two-threshold version	4-20 mA version		two-threshold version	4-20 mA version	two-threshold or measuring RS-485 version

Stationary detectors of toxic, explosive gases and oxygen of the DEX® and DG type are designed to detect and signal the presence of gases with concentrations harmful to people or dangerous in the work and life environment. DEX® detectors, depending on the version, meet the requirements of Directive 2014/34/EU (ATEX) in the area of application: or or .

The detectors are available in the following versions:

- two-threshold (with factory-set alarm concentration thresholds) — DEX/F, DEX/F-G and DG /F type;
- concentration measuring (with passive analog output in the 4-20 mA standard) — DEX/P, DEX/P-G, DEX/A, DEX/A-G (threshold operation) and DG/P type;
- addressable with a digital output in the RS-485 standard (with the MODBUS RTU protocol) — DG/M type;
- concentration measuring type with two analog outputs (active current 4-20 mA and voltage 2-10 V) — DG/PV type (for use with control panels/ controllers of other manufacturers)

All models of detectors are equipped with INTERCHANGEABLE semiconductor, catalytic, electrochemical or optical (Infra-Red) sensors selected for the application. Replaceable, intelligent sensor modules have built-in algorithms for thermal compensation, linear compensation, calculation of weighted averages (TWA, STEL), measurement history and signaling of exceeding a recommended calibration period. The interchangeability of the sensor modules enables the parameters of the detector to be changed without the need to disassemble / modify it, and facilitates, accelerates and significantly reduces the operating costs of the detection system.

EXCHANGEABILITY OF SENSORS = COST-EFFECTIVE LONG-TERM OPERATION

The modular design of the DEX® and the DG detector based systems guarantee fast design and simple installation.

Each detector comes with an individual certificate issued by GAZEX Calibration Laboratory operated under EN ISO/IEC 17025 standard and controlled by the Polish Centre for Accreditation (PCA).

Control Units MD MDP

Control Units MD type are designed to:

- power supply for two-threshold type DEX/F, DG/F and DG.EN type detectors
- visually indicate detectors alarm condition
- check wire connections to detectors and their power supply
- control external devices like automatic shut-off valves, other solenoid valves, fans, contactors, etc.
- control external optical or accoustic signaling devices
- communicate with data transmission or data logging systems via RS-485 or GSM.

Control Units MDP type have all of the above features and are additionally designed to work also with type DEX/P, DEX/A and DG/P detectors equipped with 4-20mA standard output.

MD-1.A/T and MDP-1.A/T are single channel Control Units for two-threshold or 4-20mA output detector (for mounting on DIN rail).
